

MARCH TO GLORY

A strategic game set in the Napoleonic era, where the player must balance army power and morale, making tough choices and tactical moves to achieve victory and become the Emperor of Europe.

The game at a glance

Command the campaign, not the army.

March to Glory is a turn-based strategy game set during Napoleon’s invasion of Russia.

Napoleon’s army marches on its own. The player leads the agents who decide whether it reaches the next battle strong, motivated and ready to win: scouting, sabotaging, raiding supplies and conquering villages along the way.

GENRE	Turn-based strategy
PLAYERS	Single player
PLATFORM	PC
CONTROLS	Mouse & keyboard
STORES	Steam, Slitherine
LANGUAGE	English
ENGINE	Unity

The core loop

1 March

Each turn Napoleon's army advances one cell along a path that is always visible on the map. As it moves, the fog of war lifts.

2 Prepare

Agents spend their action points: gathering intelligence, sabotaging supply lines, cutting the chain of command, boosting power and morale.

3 Battle

Battles last several turns, based on the gap in power and morale. Agents keep weakening the enemy to shorten the fight.

4 Decide

At key points the player chooses: rest to recover, advance early, or pick the next objective at a crossroads.

Every decision feeds the same two numbers: the army's Power and Morale.

An army with a will of its own

The army is not controlled directly by the player.

It advances cell by cell towards the next point of interest. Its route and the turns left before the next battle are always shown on the map.

Only at specific points (after a battle and at crossroads) can the player give it orders. The goal: set the pace of the game and push the player to find the best way to strengthen the army before the next battle.

Rest

After a battle, the army can rest for a limited number of turns to recover Power and Morale before resuming the march.

Advance

March early, giving up the benefits of resting, to reach the next objective before the enemy reinforces it.

Choose a destination

At a crossroads, pick one of two objectives with different bonuses. The army never goes back: the other path is lost.

Power and Morale

Power

Integer value

- The army's military strength: troops and equipment.
- Raised by raiding weapon deposits and holding settlements.
- Lost during battles, recovered by resting afterwards.

Morale

0–100%

- The army's mood, fatigue and enthusiasm.
- Below 50%: battle penalties. Above 50%: battle bonuses.
- Drops a little every turn of marching; raised by food and agents.

Damage per turn = Power × Morale

Enemy armies follow the same rules, and agents can lower both values before and during a battle.

Battles that last

Contact

The army enters the same hex as an enemy army: the battle begins, and it can last several turns.

Turn by turn

Each turn both armies deal damage based on their Power and Morale. A message log shows how many turns are left, and agents keep weakening the enemy to shorten the fight.

The price of victory

Destroy or rout the enemy and the march goes on, but the longer the battle, the more Power the army loses. Lose it, and the campaign is over.

Prepare well, win fast: every turn of battle costs men.

Your agents

2

cells / turn

Armed band

A band of soldiers that fights behind enemy lines: raids depots, sets ambushes, conquers small settlements and destroys enemy bands.

3

cells / turn

Spy

Infiltrates enemy bands, settlements and armies. Gathers intelligence, poisons food, sets traps and turns villages to the Napoleonic cause.

4

cells / turn

Scout

Fast and far-sighted: clears the fog of war, carries supplies to the army, rigs bridges and harasses the enemy with hit-and-run attacks.

Every action earns experience: agents level up and become faster and more effective. Joined to the army, they boost its power, morale or vision.

Points of interest

Weapon deposit

Raid it or haul weapons to the army for extra Power.

Rations deposit

Bring food to the army for Morale, or poison it.

Bridge

Ambush, trap or blow it up to stop the enemy.

Small settlement

Taken by agents: passive bonuses or new recruits.

Medium settlement

On the army’s path: train, raid or reinforce it.

Big settlement

The city that ends the level once conquered.

Artillery position

Boosts nearby enemy Power until destroyed.

Command camp

Kill the general to break enemy Morale.

A living enemy

The Russian AI pressures the player: it steals resources, hunts agents, sets traps and disrupts every plan. Alongside its own armed bands, spies and scouts, it fields special units built to defend the homeland.

Trapper

Blocks, ambushes and signals Napoleonic agents to other Russian units. Invisible until discovered.

Dog Master

Hunts and kills agents with two packs of dogs that roam freely around him.

Sniper

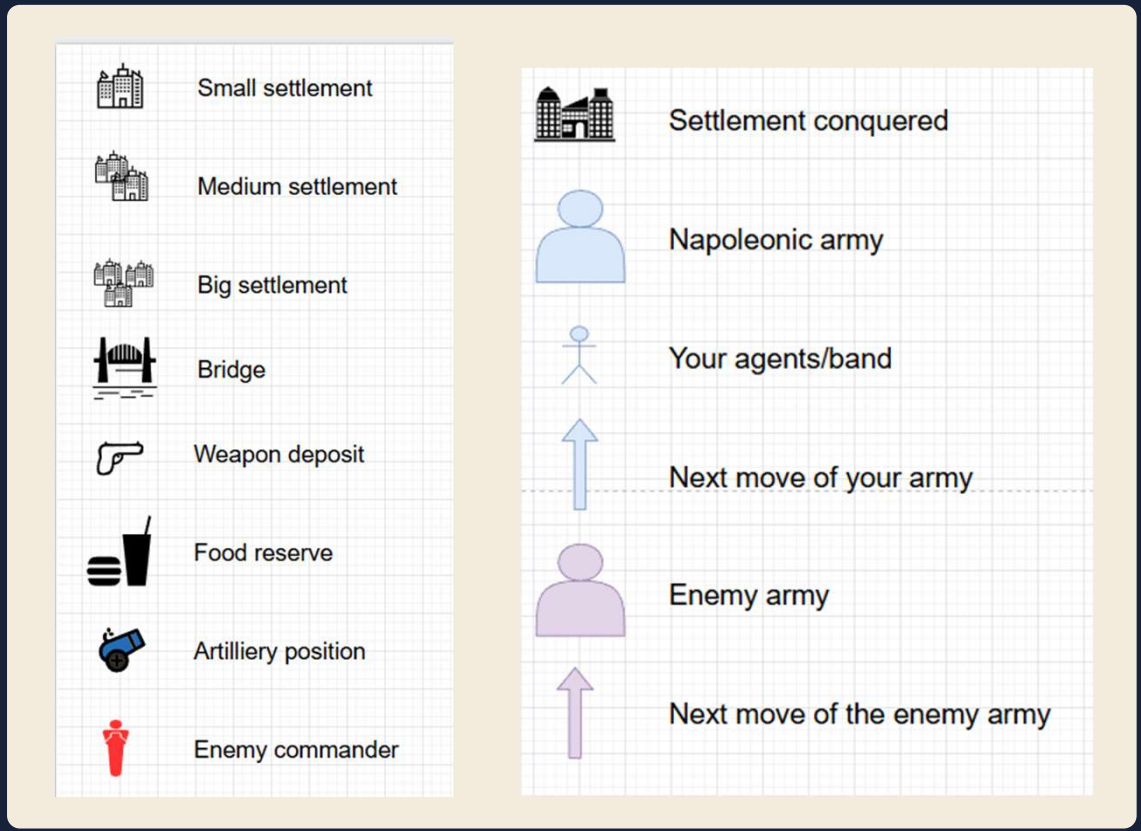

Defends key cells and roads within a cone of vision, hidden until the first shot.

Russian armies follow the same Power and Morale rules as the player's. Each turn the AI decides whether to attack Napoleon's army or fortify a nearby settlement.

Gameplay walkthrough

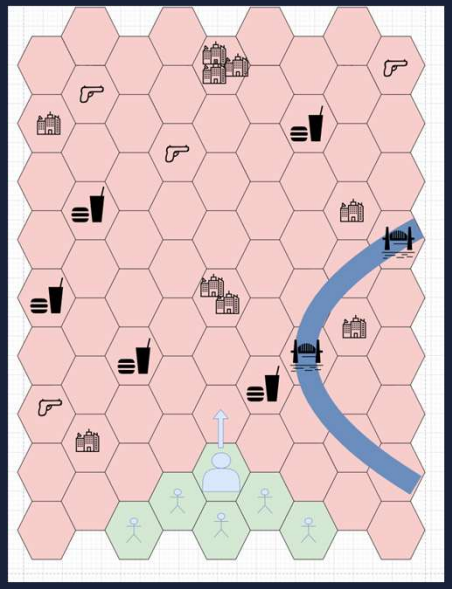

Four turns from the paper prototype show how agents shape a battle before the army even arrives.

Red hexes are enemy territory, green hexes are under Napoleonic control. Agents clear the fog as they move.

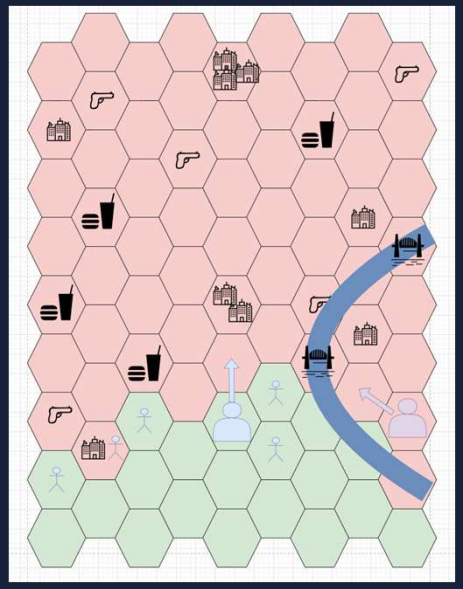

Four turns of play

TURN 1

The army sets off and five agents are ready to move. The river can only be crossed via bridges.

TURN 2

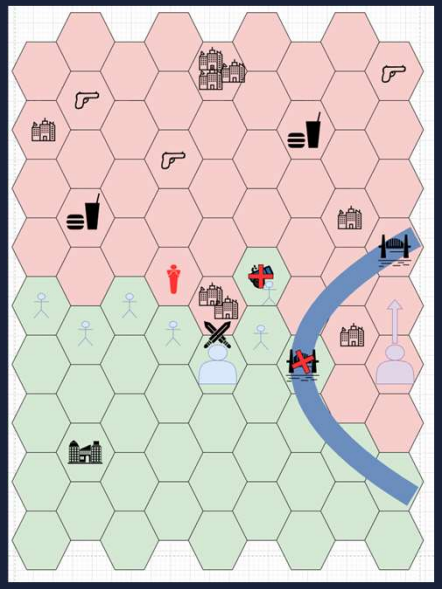

The fog lifts. An enemy army appears, heading for the medium settlement.

TURN 3

Raids raise Power and Morale, a village is converted and the bridge is sabotaged.

TURN 4

The battle starts with the artillery destroyed and the commander found: a shorter fight.

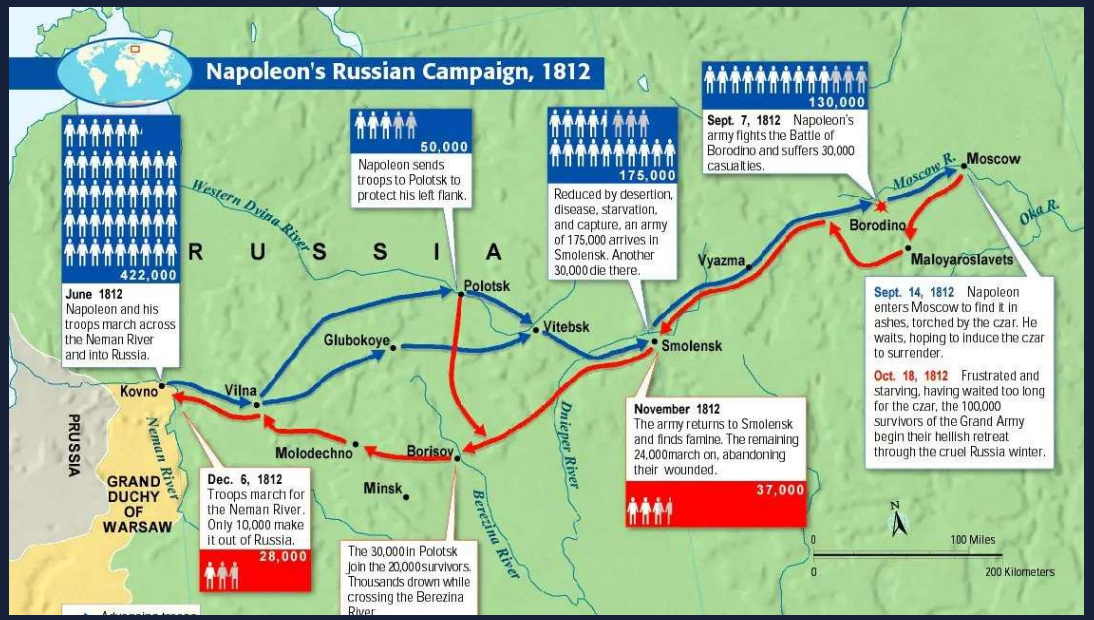

The road to Moscow

Set during the 1812 Russian Campaign, the game follows the sequence of battles fought on the way to Moscow.

Each mission is one of those battles: the player must keep up the momentum and preserve the army.

Lose at Moscow and the army retreats home along a different route.

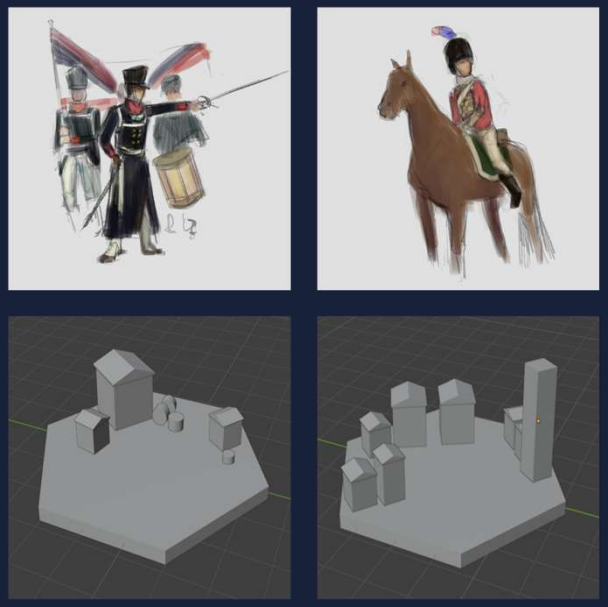

“What if?” Conquer Moscow and push on into the heart of Russia to defeat the Tsar.

Visual target

Underlying grid **Prototype** **Development target**

Concept art and settlement blockouts

Moving pieces across a chessboard, with an overall realistic look: a blend of the Total War series and tabletop wargames.

References

Gameplay reference

Unity of Command

Turn-based operational strategy on a hex map, where momentum decides the campaign.

Total War series

The realistic, painterly look of a historical campaign map.

Tabletop wargames

Clear, readable pieces moved across the board like on a chessboard.

Why March to Glory

Napoleonic Russia

The 1812 invasion, plus a “What if?” scenario with alternative outcomes.

Strong player agency

Agents reshape the campaign map turn after turn.

Indirect command

The army is not fully yours: adapt to a campaign that keeps moving.

Specialised agents

Unique abilities shaped by position and terrain.

Morale and Power battles

Morale, equipment and logistics matter beyond the commander’s orders.

Modular campaigns

New Napoleonic campaigns plug into the same structure.

Flexible core

The same framework can move to other historical settings.

Playable prototype available
Publisher build for Windows (Unity, DirectX 12).
